

Architecture Diagrams

This section provides visual representations of the system architecture, data flow, and key processes. The diagrams illustrate how different components interact and how data moves through the system.

Overview of Diagrams

The following diagrams are included in this document:

Diagram	Description
System Architecture	High-level view of all components and their relationships
Authentication Flow	Sequence of steps for user registration, login, and protected route access
Feedback Generation Flow	How feedback is generated (rule-based vs. AI) and previewed
Data Flow	Complete request/response cycle from client to database
File Upload Flow	Optional future enhancement – handling file attachments
Deployment Architecture	Production infrastructure on Vercel, Render, and MongoDB Atlas

These diagrams serve as both technical documentation and a communication tool for stakeholders. They demonstrate the **modular design**, **separation of concerns**, and **scalability** of the platform. All components are clearly defined, showing how the frontend communicates with the backend, how the service layer abstracts business logic, and how data is stored and retrieved from MongoDB.
